

# NXJ Reporting

*An optional add-on module to NXJ Enterprise that allows for powerful business reporting*

In today's business environment where access to information is critical for decision making, choosing the right enterprise information delivery solution is paramount. Enterprises require timely, actionable reports that provide highly usable business information and intelligence, without the deployment, management, and usage complexities inherent in traditional analytical reporting solutions. NXJ Reporting solves these challenges and provides a solution that delivers fast, actionable information across an enterprise.

## Actionable Information

As the cornerstone of a reliable information delivery system, Reports provide end users with the ability to slice and dice data, dynamically change the view of data, and analyze data to glean useful business information. Whether an organization wants to deploy pre-designed reports or empower end users with Web-based, ad hoc reporting capabilities, Unify NXJ Reporting allows for both.

With Unify NXJ Reporting, organizations can quickly create sophisticated reports that facilitate communication and sharing of business information. Unify NXJ Reporting allows end users to easily filter, search, group and sort data dynamically. Unify NXJ Reporting also allows data to be easily accessed and analyzed through a user-friendly, Web-based, ad hoc tool.

## Information for the Entire Enterprise

Enterprise readiness is critical to the deployment of an actionable information delivery solution. Enterprise ready means that both the technical and end-user requirements of an organization are satisfied—from ease of integration to ease of use. An enterprise-ready solution gains higher adoption rates across an organization, as well as a faster return on investment.

Because NXJ Reporting is J2EE-based, it integrates easily into an enterprise system, allowing organizations to leverage their existing IT investment. NXJ Reporting can access any data source and provides rich APIs for system configuration and security integration. NXJ Reporting requires minimal training. An intuitive report designer and a Web-based, ad hoc analysis tool allow users of all levels of expertise to quickly realize the benefits of actionable information.

## Performance and Scalability

NXJ Reporting was engineered for peak performance, with streamlined system flow and optimized memory and buffer usage. The result is fast response times for ad hoc and scheduled reports, and the ability to handle extremely heavy workloads. In mission-critical environments, NXJ Reporting can scale to utilize additional CPU and memory resources for increased workloads. And, the clustered server option provides automatic load balancing and failover protection.

A robust performance monitor is included that allows system administrators to drill down into any server to view detailed system reports and various system logs. The performance monitor also features a Web console that enables the servers to be controlled remotely.

Organizations worldwide rely on NXJ Reporting to deliver actionable information every day. They tout NXJ's ease of integration, enterprise readiness, and minimal training requirements as reasons for their high internal adoption rates. With built-in security, failover protection, and support for any data source, NXJ Reporting was developed with an enterprise's entire information delivery needs in mind to provide sophisticated reports that can be easily created and analyzed to help drive better business decisions.
