

DELIVER HIGH PERFORMANCE BUSINESS APPLICATIONS

Unify VISION is a complete solution for companies attempting to deliver high performance business applications. Unify VISION AppServer is the foundation of Unify's solution.

It is an environment that supports central coordination and management of the business components or services necessary to run networked, distributed applications. It supports universal client access, allowing any user running on any system to access the information they need.

Universal Access

With Unify VISION AppServer, IT departments can deploy application services across a common, robust environment and make those services available to clients across and outside of the enterprise. Unify VISION AppServer provides universal access to all clients whether through a Web browser or ActiveX application.

Central Control

VISION AppServer provides easy, centralized administration and management of all services network-wide from a central management console. In addition, it allows for simple, deployment-time configuration settings for reconfiguration and modifications to underlying systems, applications, and network topologies.

Dynamic Scalable Services

VISION AppServer is based on a unique system architecture that provides scalability at every level of the system. It provides high-performance peer-to-peer asynchronous messaging, as well as an integrated publish-and-subscribe event model across heterogeneous platforms. By allowing application services to be replicated across servers, applications are continuously available. In the event of server or network failure, Unify VISION AppServer automatically reroutes messages to available servers.

Support for Enterprise Environments

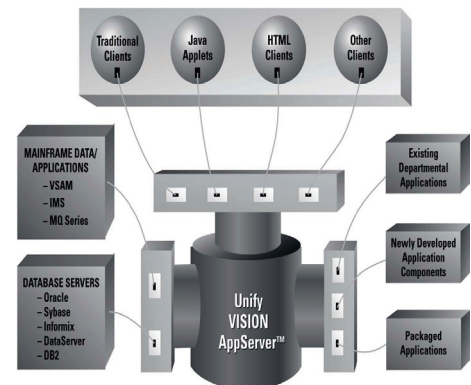

Utilizing a unique agent-based architecture, Unify VISION AppServer provides built-in application instrumentation coupled with seamless integration to all the leading enterprise management systems.

HIGHLIGHTS

- BUILT-IN BUSINESS COMPONENT FRAMEWORK REDUCES TIME TO MARKET
- SEAMLESS INTEGRATION WITH LEGACY AND PACKAGED APPLICATIONS LEVERAGES EXISTING INVESTMENT
- DYNAMIC SCALABLE SERVICES PROVIDE HIGH AVAILABILITY
- PARALLEL SERVER ARCHITECTURE MAXIMIZES APPLICATION PERFORMANCE
- SUPPORT FOR WINDOWS VISTA AND WINDOWS SERVER

Rapid Business Rules Adaptability

VISION AppBuilder provides a high-level business language that allows developers to focus on defining business rules rather than on the underlying technologies. The business language abstracts the notions of distributed computing as well as databases, operating systems and user interfaces.

Unify VISION AppServer ensures universal access to any application anywhere, anytime.

Collaboration

VISION AppBuilder stores component definitions within a shared object repository. Access to components can be shared across multiple projects. Simultaneous access to component definitions is controlled automatically. This enables component development by teams of developers across several projects.

Internet Integrator

Internet Integrator is a module of Unify VISION designed to allow organizations to develop and deploy Web pages that access databases and applications.

Internet Integrator will take an existing database and client/server application and provide extremely dynamic and secure access via a Web browser. By using Internet Integrator, new Web enabled applications will have the look and feel of corporate Web sites and portals and be available in a real-time, dynamic fashion, providing users with up-to-the-minute information.

Internet Integrator takes full advantage of VISION AppServer including:

- Secure information support using SSL (Secure Sockets Layer)
- Multi-Server Configurations
- Automatic server failover
- Dynamic server load balancing
- Real-time debugging
- Comprehensive Object Oriented 4GL language
- Web Server support for Apache, Netscape and Microsoft IIS and PWS
- UNIX, LINUX and Windows Vista, Windows Server 2008

TECHNICAL INFO

- Support for current version of DataServer
- 64-bit data type
- Unicode language support
- Certified for Windows 2000, XP, Server 2003, Vista, Server 2008
- Microsoft SQL Server native support using ODBC 3.5
- Enhanced Functionality with the Importation of Unify ACCELL/SQL
- List and combo boxes enhanced to support non-string values
- ActiveX component integration
